

# Data tools for the bottom-up city with SharedStreets

# What is SharedStreets?

SharedStreets is a nonprofit organization.

We build free **open source software** and **digital infrastructure** to support new ways of managing and sharing data that **keep cities moving.**

# All tech has embedded values. Here are some of ours.

City-owned and operated workflow

Explore questions we have about new mobility in ways that are **open** and **transparent**

Work with data while limiting privacy risks

# PUDO Data for Regulatory Studies

Raphael Dumas

Project Lead, Big Data Innovation Team, City of Toronto

# Transportation Impact Study of Vehicle-for-Hire

- The Big Data Innovation Team worked with MLS and the University of Toronto Transportation Research Institute on the VFH by-law review, which regulates taxicabs, limousines, and private transportation companies such as Uber and Lyft.
- The purpose of this report was to explore:
  -  What are the trends and patterns in vehicle-for-hire travel?
  -  How has this travel impacted the transportation network?
  -  What are the impacts on travel demands and travel choices?

# Assessing the Curbside Impacts of VFH

- We wanted to answer the following questions on curbside impacts:
  - Where are the hotspots of activities around curbside regulations?
  - What are the policy implications on curbside management?
  - What are the localized impacts of pick-up and drop-off activities?

# Pick-up & Drop-off (PUDO) data

- Curbside pick-up and drop-off data were acquired using SharedStreets  as a broker in partnership with Uber and Lyft
  - Temporal Resolution: minimum 1 hour (9 weeks in 2018 from Jan – Sep)
  - Spatial Resolution: 10m
  - Extent: City of Toronto
- Threshold for number of trips to avoid this data being personally identifiable
- GPS signals are not precise enough to determine side of street on one-way street, all pick-up and drop-off activities on either side of those streets will be aggregated to the right hand side

# How We Use PUDO Data

Bike lanes

TTC subway delay

PUDO hotspots near bike lanes

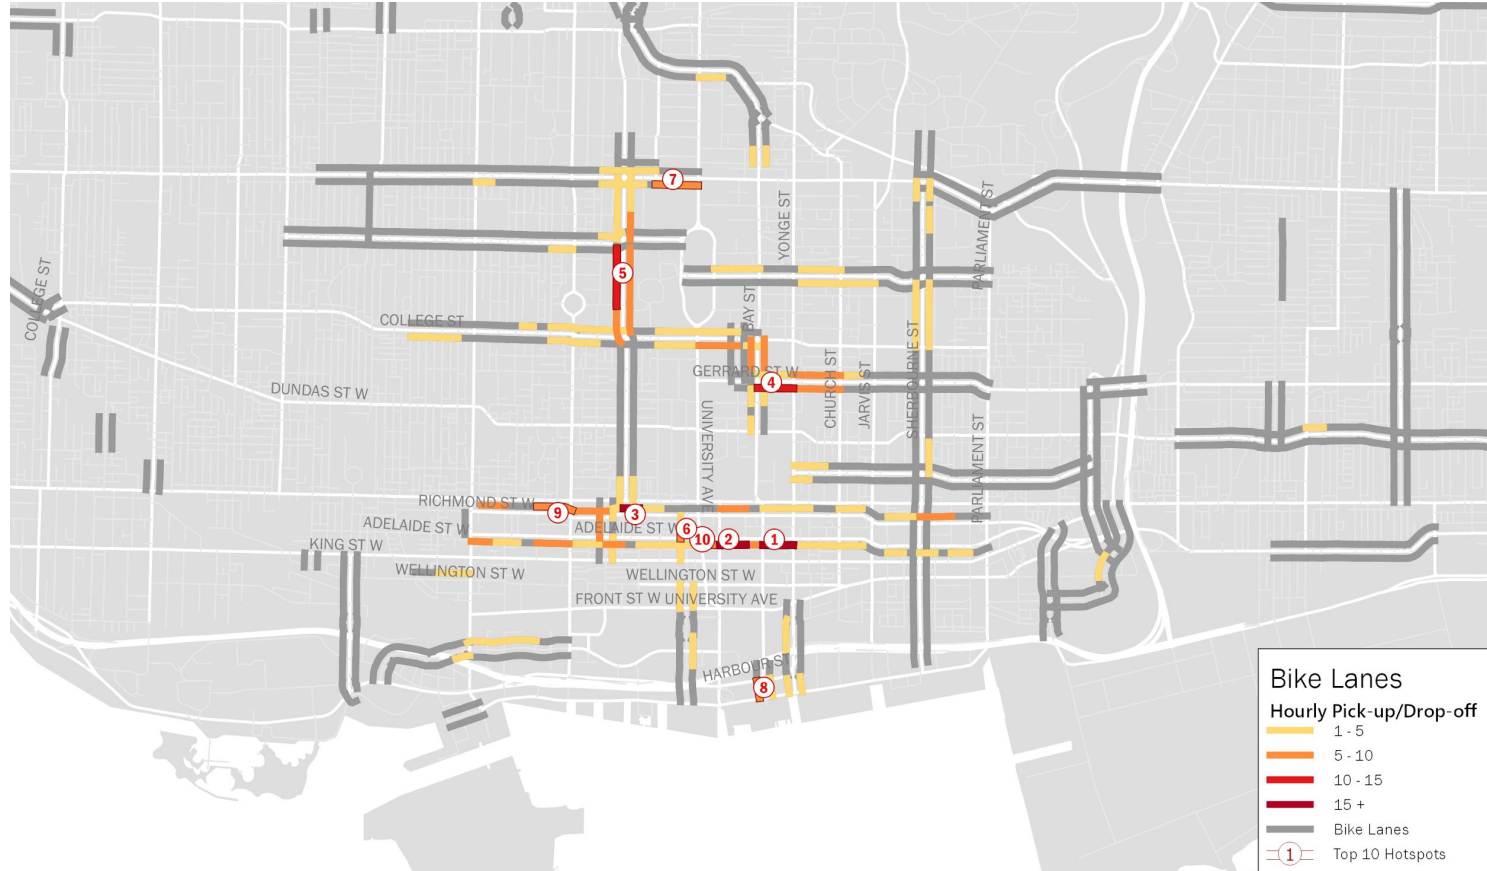

PUDO hotspots near no-stopping zone

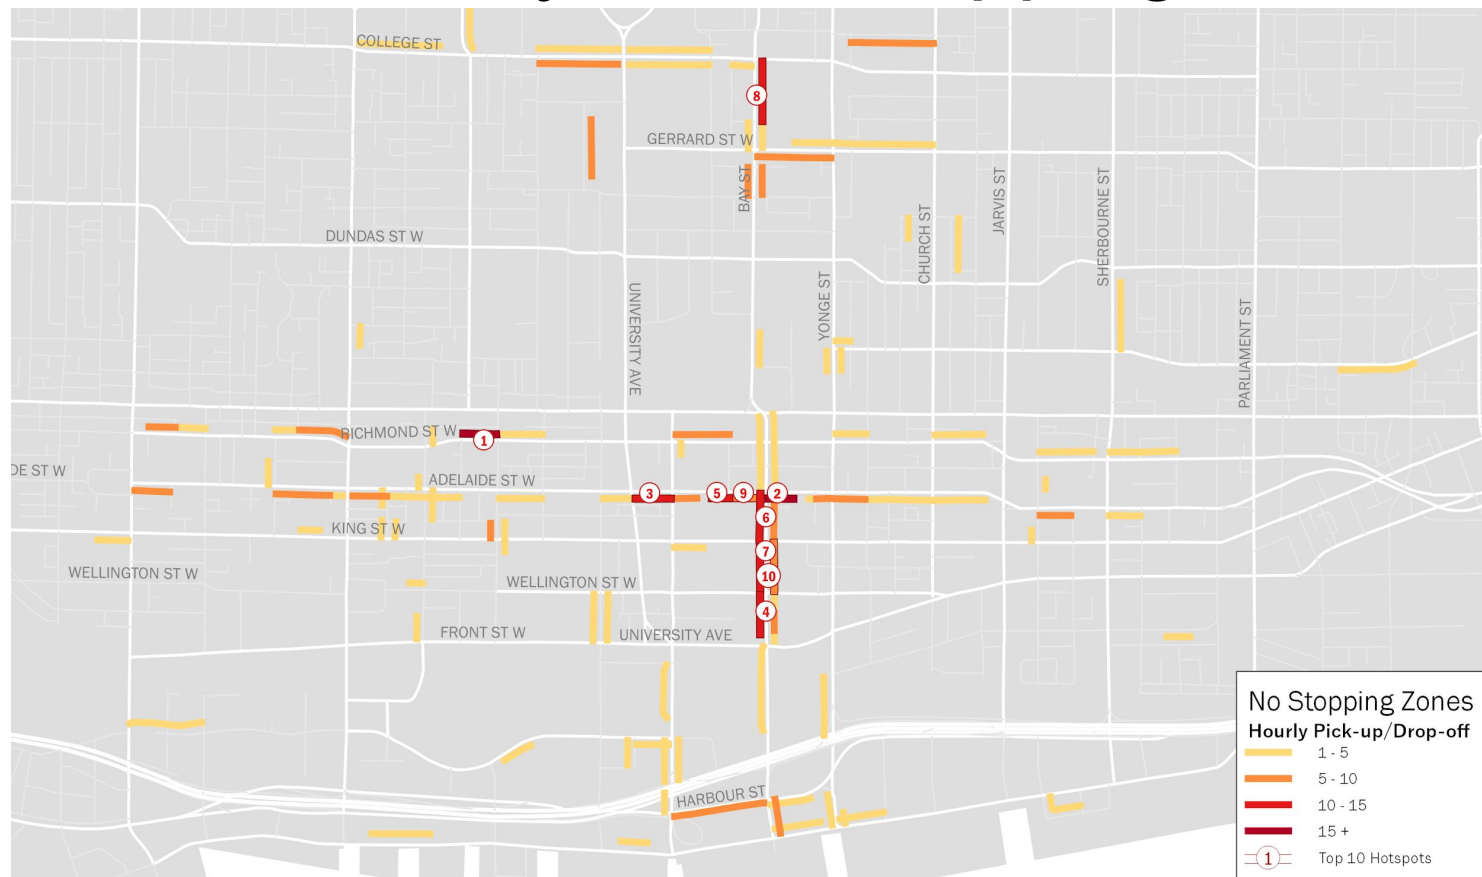

PUDO activity during subway delay

# PUDO Activity Near Bike Facilities

Hotspots of Pick-up/Drop-off activity near Bike Lanes (7 A.M. to 7 P.M.)

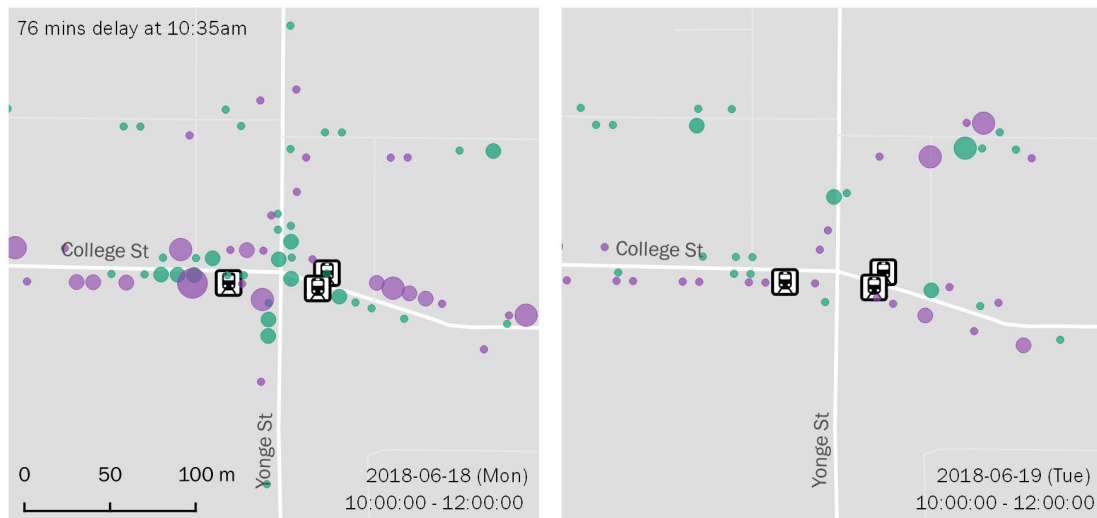

# PUDO Activity in No-Stopping Zones

Hotspots of Pick-up/Drop-off activity in No-Stopping areas (7 to 10 A.M.)

# PUDO During a Subway Delay

- PTCs are often an alternative to transit users during transit service disruption
- We can look at pudo activity during subway disruption to understand what extent this alternative is being utilized
- There is a large increase of pudo activity on June 18, 2018 at College Station after a 76 min delay relative to the same period the following day
- While PTCs services can increase the resiliency of the transportation network, when shuttle buses are dispatched for delays, the resulting increased PTCs activity may also disrupt their operation

# Nightlife to Network: Piloting “PUDO” Zones in the District of Columbia

**Stephanie Dock, Research Program Administrator  
District Department of Transportation**

# Connecticut Avenue Nightlife Restriction Pilot

Connecticut Ave./Dupont Circle is a well established nightlife destination

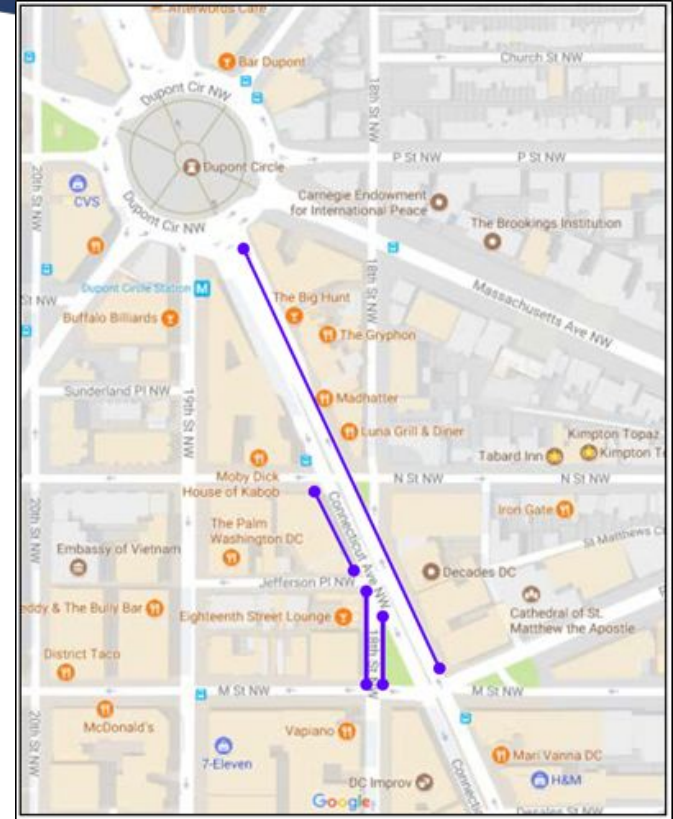

Key Concerns:

- Illegal/unsafe passenger loading and ride hailing from travel lanes
- Congestion and potential for crashes

Root Cause: Cheap and unrestricted parking along corridor

Solution: No Parking Thurs-Sat 10pm-7am

Pilot launched Oct. 2017, towing enforcement added later

# Pick-up/Drop-off (PUDO) Zone Pilot

## Success of the nightlife pilot → standardize the PUDO Zone concept

- Worked with Shared Streets to begin identifying high PUDO locations for TNCs.
- Collaborated with partners to develop new signage and enforcement protocol

## Objectives

1. Safety: facilitate safe and efficient movement of people and goods to and from the curbside
2. Curbside Efficiency and Utilization: reduce curbside turnover time, decrease queue lengths, and increase trip completion
3. Traffic Control: make space for all modes to interact with the curbside while improving throughput

# Pick-up/Drop-off (PUDO) Zone Pilot

## New Considerations

- Complete removal of metered parking (clear curb)
- Simple, concise regulations and signage
  - Created new violation for parking in PUDO zones
  - Higher fine \$35 □ \$75
- Commercial loading allowed
  - OK in No Parking zone
- Use of “blades” (below) to make context-sensitive variations

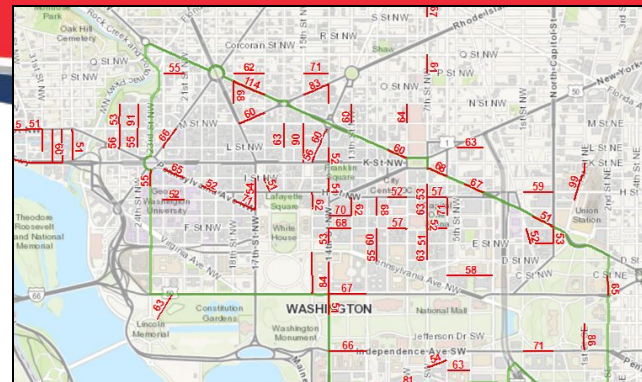

# Pick-up/Drop-off (PUDO) Zone Pilot

## Formalization of Site Selection Process

- Shared Street data is primary source for new locations
  - TNC activity was aggregated by block
  - Top 100 blocks in the District ranked by activity (8am-8pm)
- Additional Data

Quantitative data	Qualitative data
Taxi and TNC pick-up/drop-off	Land Use and Zoning
Crash data	Neighborhood Typology
Transit Availability	Development Plans
Parking Violations	Curbside Programming
Parking Meter Revenue and Turnover	Site Observation (illegal/dangerous activity such as blocking travel lanes)

# Pick-up/Drop-off (PUDO) Zone Pilot

## Formalization of Site Selection Process (cont.)

- DDOT developed an SOP with guidelines on evaluation of these locations.
- Site visits were conducted to confirm the curbside programming and observe pick-up/drop-off activity.
- Evaluations were produced in memos with recommendations about whether to deploy a PUDO zone

### Existing Conditions

#### Land Use

This proposed pick-up/drop-off (PUDO) site is characterized as a "mixed-use/high-intensity" neighborhood, located near the edge of the central business district. The site is zoned for high-intensity commercial usage, and features a dense concentration of employers including CNN, Federal Energy Regulatory Commission, and World Resources Institute. The [District of Columbia's Comprehensive Plan](#) indicates future land use for this area will continue to be high-density commercial usage.

### Summary Table

SOP Criteria	Data	Source
Neighborhood Typology/ Land Use	Mixed-Use/High-Intensity	DDOT Curbside Management Study
Daily TNC pick-ups/drop-offs	99	Shared Streets
Passengers per trip	<b>Undetermined</b>	Site Visit
Taxi/TNC dwell time	<b>Undetermined</b>	Site Visit
Annual Meter Revenue (block average, 2014-2016)	\$14,072	Internal Data
Average Paid Parking Time (minutes, 2017-2019)	50.6	Internal Data
Average Annual Parking Violations (2016-2018)	342	Internal Data
Transit availability (1/4 mile)	2 Metro Stations, 2 DC Circulator stops, 12 Metrobus stops	Open Data DC
Current Curbside Programming	2 hour metered parking metered stands Monday-Saturday, 7am-6:30pm; No parking; No standing or parking	Site Visit
Illegal Activity (double-parking, blocking bike lanes)	Pick-ups in travel lane; double-parking	Site Visit
Street Furniture	Street trees; parking meters; lamp posts; trashcans	Site Visit
Lack of Assets (missing signs /meters)	On the 800 Block of 1st St NE, there is one parking meter for an area covering 3 car spaces. There clearly used to be another meter but it had been physically removed.	Site Visit
Stakeholders	Nearby commercial landlords; Union Station management;	Site Visit

### 15th St NW Parking Violations

Year of Ticket Issue Date

### 1100 Block 15th Street NW Parking Meter Revenue

# Pick-up/Drop-off (PUDO) Zone Pilot

## Findings

Evaluation and feedback from stakeholders confirmed that PUDO zones were successfully clearing the curb space and causing a reduction in illegal activities.

	Goal	Metric	Standard	Data Source
Ride hailing/Ridesharing	Lower dwell time at the curb during pick-up/drop-off	Dwell time (in seconds)	< 60 seconds	DFHV or SharedStreets
	Reduction in the number of empty TNC vehicles/taxis idling at the curb	Idling vehicles	0	DFHV or SharedStreets
	Improved average TNC/cab speed within a 3-block radius of the zone (under 20 miles/hour)	Travel speed (in MPH)	80 – 100 % of speed limit	DFHV or SharedStreets
	Improved uptake time* ( <i>Data from TNCs</i> ) * time from vehicle arrival on pick-up block to arrival at the curbside	Uptake time (in minutes)	< 120 seconds on streets with LOS of C or higher	DFHV or SharedStreets
Traffic Volume/Safety	Improved traffic flow in the area	LOS	At least one level improvement D or higher; at least two levels of improvement for E	TOSD
	Reduction in pedestrian/cyclist injuries	Injuries	0	MPD and Taras2 –Crash reporter data from WABA, Vision Zero Safety Map
	Decrease in illegal parking in the PUDO zone	Citations	10% reduction from previous quarter until 50% of historic average	DPW PEMA
	Improved bus on-time performance	On-time performance (in percent)	90% on time or better	TDD or WMATA

# Pilot: Curb inventory

# Mapping the curb

Difficulties: structured **regulation**, appropriate **geography**

# Towards a “GTFS for the curb”

- Cities struggling to solve this problem
- Lots of companies and vendors springing up
- Proprietary methods in the absence of collaborative, open standards
- SharedStreets proposes an open standard (CurbLR)  
Developed with input from DC, Boston, Ford Mobility, civic tech

# Start by mapping roadside assets, like signs and meters

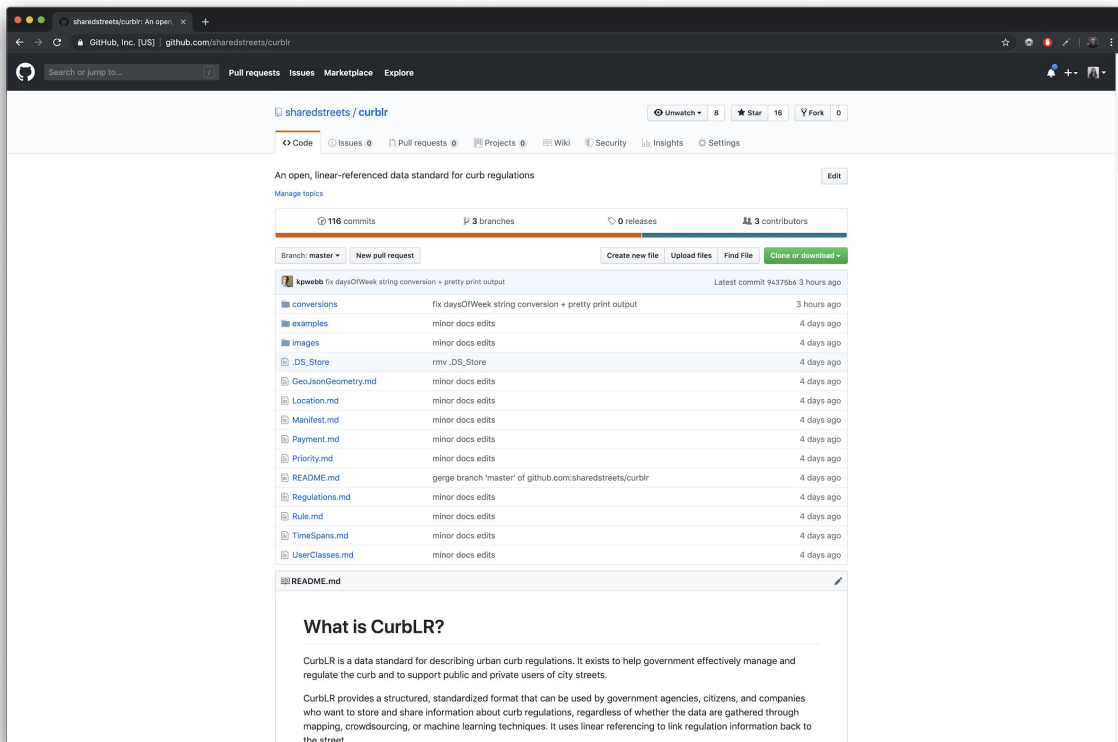

- = **Resident permit parking,**  
Mo-Fr, 6pm-10am
- = **Loading zone,**  
Mo-Fr, 9am-4pm; Sat, 9am-12pm
- = **Street cleaning,**  
2nd & 4th Mo, Apr-Dec, 12-4pm
- = **Snow emergency zone**

Variety of ways to do this (high- and low-tech options)

# CurbLR: A data standard for curb regulations

### What is CurbLR?

CurbLR is a data standard for describing urban curb regulations. It exists to help government effectively manage and regulate the curb and to support public and private users of city streets.

CurbLR provides a structured, standardized format that can be used by government agencies, citizens, and companies who want to store and share information about curb regulations, regardless of whether the data are gathered through mapping, crowdsourcing, or machine learning techniques. It uses linear referencing to link regulation information back to the street.

Available and fully documented on Github, with examples and sample data feeds

# Signs Will Guide Your ~~Way~~ Curb

d.

**Stephanie Dock, Research Program Administrator  
District Department of Transportation**

# Where Can I Park?

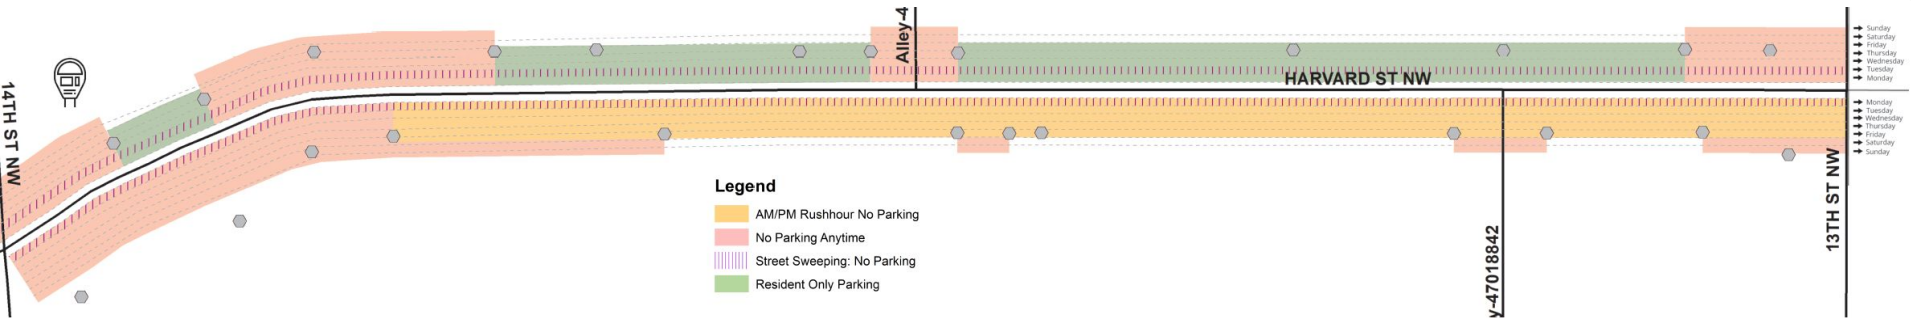

The Dream: a rich and detailed parking zone GIS

Our Approach: map the signs, not the zones

The Benefits:

1. Sign asset maintainers know exactly what their inventory is at any point in time.
2. Curb/parking zone data can be easily extracted.
3. Inform other analyses that interact with the curb.

# The Result: Mapped Zones

# SignWorks: Keeping the Inventory Alive

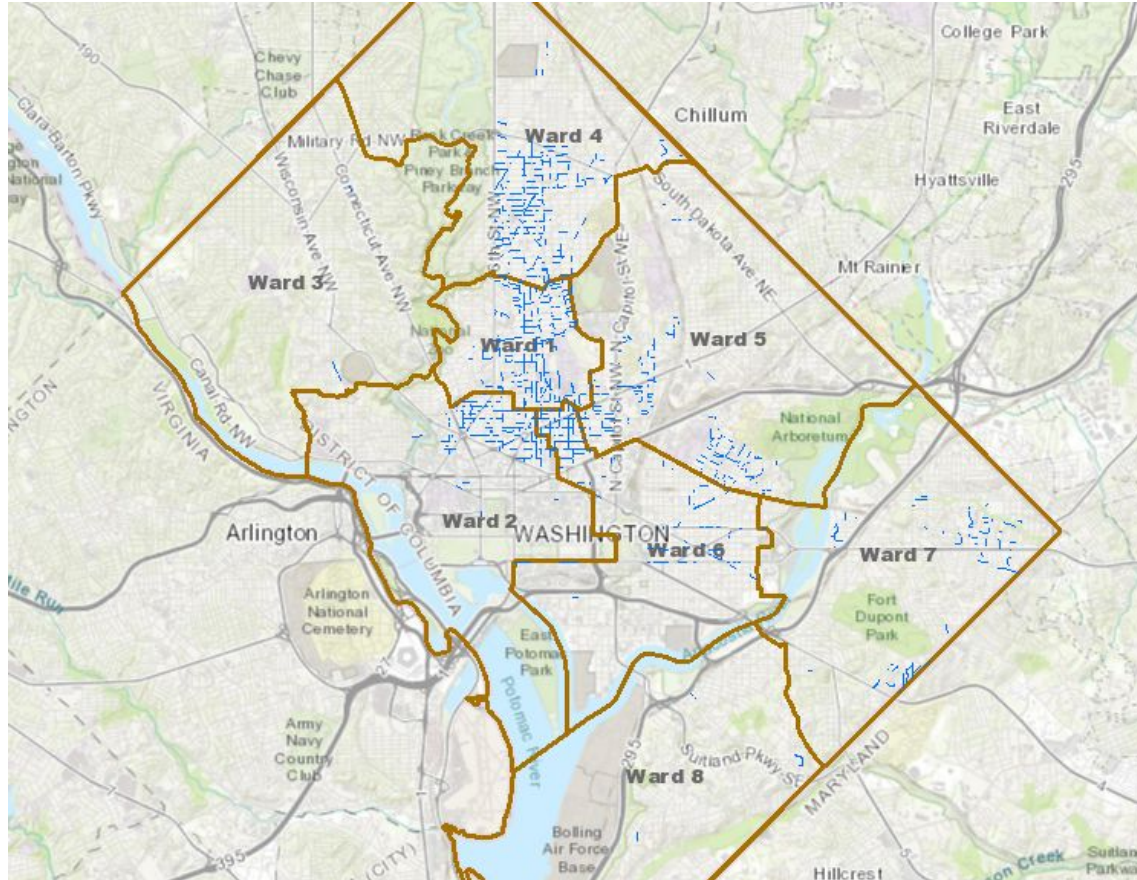

Signworks is a GIS-based inventory management system built for managing signs.

**Signworks Inventory** is a simple, straightforward GIS web editing application that is intended for DDOT staff to update and correct the GIS sign inventory. Currently can explore our signage from your desktop.

**Signworks Requests** is a GIS-based sign inventory request system built for requesting signs. It is meant as a replacement to the manual 'Shop Order' with workflow processes notifies appropriate reviewers. Once complete, request is packaged up and sent to Cityworks for fabrication and installation in the field.

# Another Example: Street Sweeping

<https://arcg.is/gmqzX>

# Visualizing Curb Data

Saadiq Mohiuddin

*Project Engineer, City of Calgary*

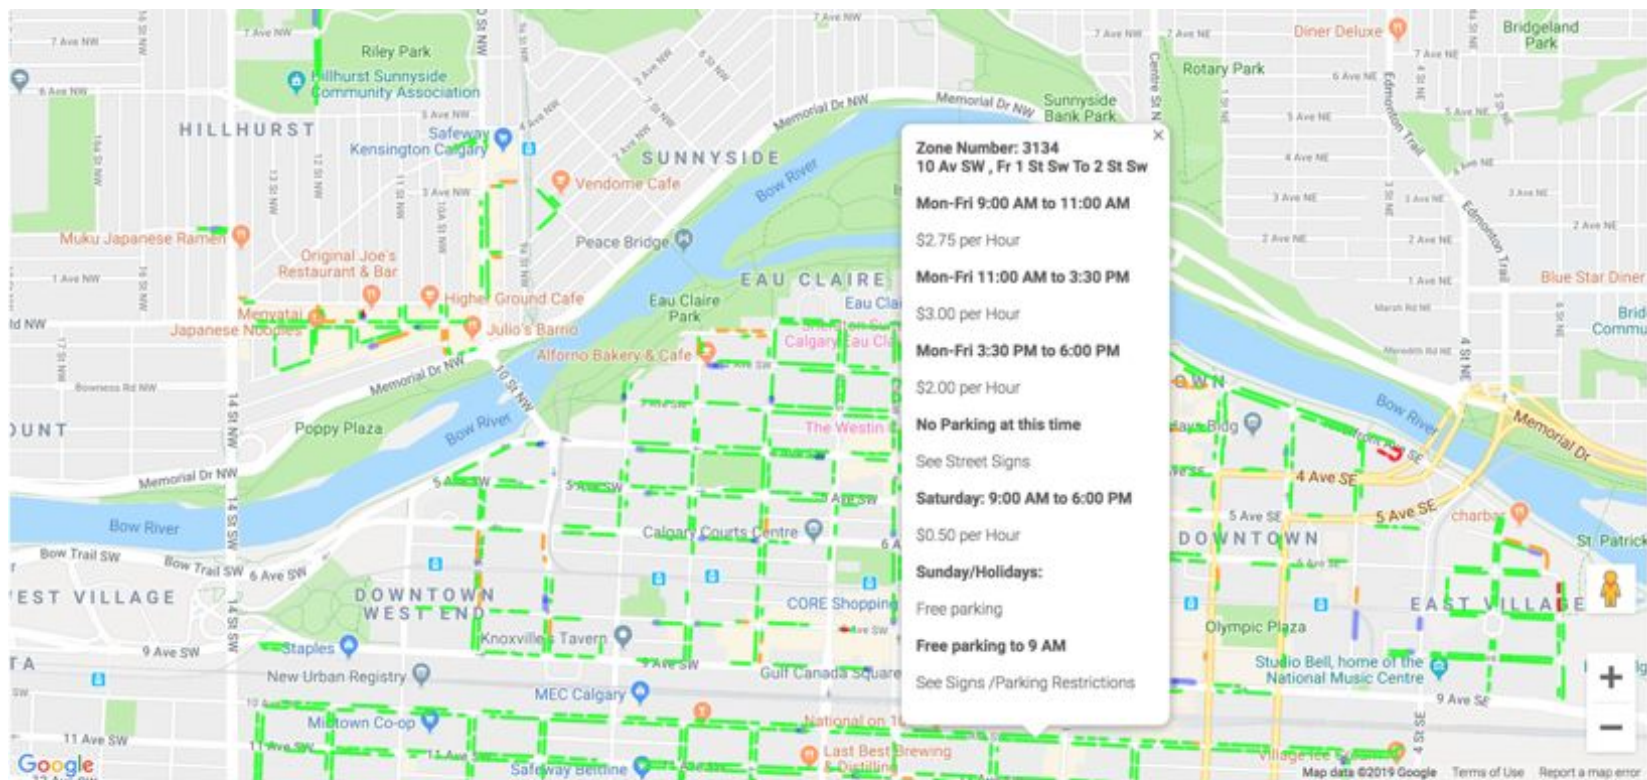

# Objectives

- Explore how TNC pick up/drop off, taxi zone and vehicle 'roaming' interact with transit (bus) performance at certain intersections
- Inventory of curbs and rules to find potential problem areas and opportunities
- Quickly pilot CurbLR spec on existing dataset of on-street parking regulations
- Create curb rule database, API and visualization using open source tools
